Task 3A:

A Brief Description of The Architecture

A user accesses an endpoint   (e.g https://xxxxxxxxxx/send-email, which triggers a Lambda function that pushes a message to an SNS topic. The SNS topic then forwards the message to an email address registered to the topic.
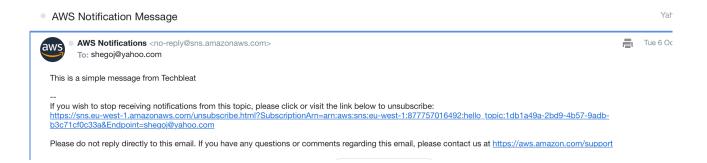

Requirements:

- Implement the architecture above

- You can use/create any endpoint you want (i.e use any name for your API-Gateway)

- Use any name you want for your SNS/Topic

- There is a Lambda function to be deployed and API-Gateway to access the Lambda. Code is here

- You will need the following AWS components

  - API-GW

  - LAMBDA

  - ROLES/POLICY

  - SNS/TOPIC

If all goes well, you should see a message similar to this:

AWS Notification Message   Yah

aws **AWS Notifications** <no-reply@sns.amazonaws.com>   🖨 Tue 6 Oc
     To: shegoj@yahoo.com

This is a simple message from Techbleat

EXTRAS

- IaC (Terraform) should be used to build the infrastructure

- Code should be saved in SCM
